Gradient descent.

Step size.

google.developers.com

$$m = 1$$

$$\text{Cost } J = 0$$

Global minimum.

Converge theorem.

$$m = m - \frac{\partial(m)}{\partial m} \times \alpha$$

Learning rate.

$$m = 0.5$$

$$\hat{y} = 0.5 \times 1 = 0.5$$

$$\hat{y} = 0.5 \times 2 = 1$$

$$\hat{y} = 0.5 \times 3 = 1.5$$

$$\text{(Left)} \quad m = m - (-ve) \times \text{small value}$$

$$= m + \text{ve} \times \text{small value}$$

$$\text{(Right)} \quad m = m - (+ve) \times \text{small value}$$

Learning Rate

Small values.

→ not too small

→ not too large

$$\frac{1}{2m} ((0.5-1)^2 + (1-2)^2 + (1.5-3)^2)$$

$$= \frac{1}{6} \times (0.25 + 1 + (1.5)^2) = 0.58$$

• Mean Absolute error

$$MAE = \frac{1}{n} \sum_{i=1}^n (y - \hat{y})$$

• Mean Square error.

$$MSE = \frac{1}{2n} \sum_{i=1}^n (\hat{y} - y)^2$$

• Cost function.

• Gradient descent.

• Learning Rate. (α)

Hypothesis $\hat{y} = mx + c$

Parameter m, c

$$\text{Cost function } J(m, c) = \left(\frac{1}{2n} \sum_{i=1}^n (\hat{y} - y)^2 \right)$$

Goal = minimize the cost function.

Repeat

$$H-T \quad h_0(x) = \theta_0 + \theta_1 x$$

Parameters θ_0, θ_1

$$\text{Cost function } J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta_0, \theta_1}(x^{(i)}) - y^{(i)})^2$$

Goal : minimize $J(\theta_0, \theta_1)$

→ Start with θ_0, θ_1 and keep changing them to reduce $J(\theta_0, \theta_1)$ until we hopefully end up at a minimum.

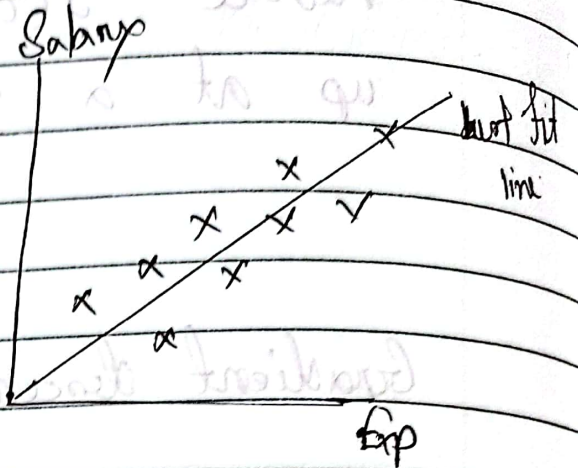

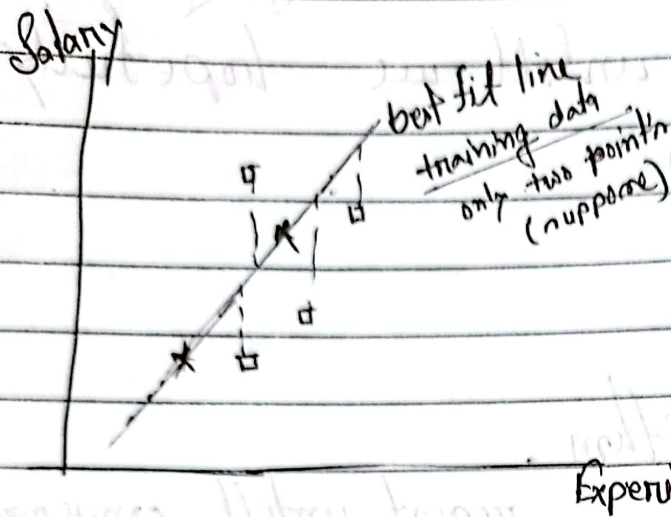

Gradient descent algorithm.

repeat until convergence

$$\theta_j := \theta_j - \frac{\partial}{\partial \theta_j} (J(\theta_0, \theta_1)) \times \alpha \quad \left. \begin{array}{l} j=0, j=1 \\ \text{learning rate} \end{array} \right\}$$

Andrew NG @ 15 A Linear Regression term and details summary in "Krish Naik" video.

Ridge and Lasso Regression.

Cost Function_{or}

Sum of Residuals $\sum_{i=1}^n (y - \hat{y})^2 = 0$

In linear Regression.

$$\hat{y} = mx + c$$

but for testing data \oplus high error.

→ Overfitting → for training, low error

→ " testing high "

high variance
↓ convert
low variance

→ Underfitting → for training data get high error and

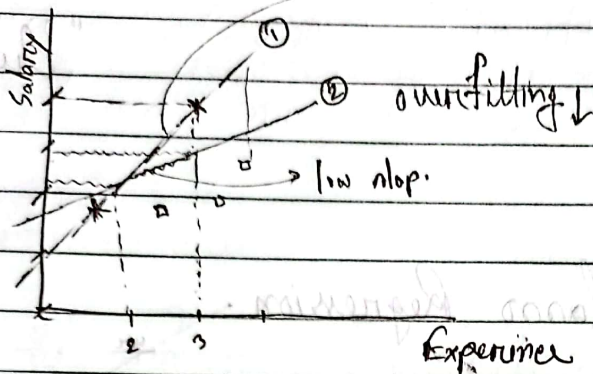

for the testing dataset getting high error.

Generalized or Good Model

Should always low bias-
and low variance.

By Ridge and Lasso
Regression

Ridge Regression.

Cost function \rightarrow

$$\sum_{i=1}^n (y - \hat{y})^2 + \lambda (\text{slope})^2$$

step slope
slope

① x -axis single unit of

change y -axis change \rightarrow slope

targer \rightarrow slope too low
too low

② Small change in x -axis

small change in y -axis \rightarrow slope

change \rightarrow slope

① let $\lambda = 1$ for example
slope = 1.69

②

Small value + 1×1^2

\rightarrow 1.39 like.

Cost $\rightarrow 0 + 1 \times 1.69$

= 1.69

$\therefore 1.69 < 1.39$

② num best fit line in
better than ①

$\lambda > 0$ to any positive value

\rightarrow Selected

tends to zero.
not to zero

Main Aim of Ridge Regression is Reducing "Overfitting".

Lasso Regression.

we

Feature Selection

Cost Function.

$$\sum_{i=1}^n (y - \hat{y})^2 + \lambda \times |\text{slope}|$$

magnitude of slope.

$$y = m_1 x_1 + m_2 x_2 + m_3 x_3 + \dots + e$$

$$\lambda |m_1 + m_2 + m_3 + m_4 + \dots|$$

slope value is very very less

those feature Remove

Moving towards zero $\rightarrow \rightarrow \rightarrow 0$

and feature will Remove.

because that is not important for Prediction.

* once a time it will be zero

"Multicollinearity"

In linear Regression.

- Keep it as usual
 - Drop the feature $[p\text{-value} > 0.05]$
- there are highly correlated, keep only one.

"when independent variables [internally] highly Correlated" \leftarrow multicollinearity occurs.

As like Pearson Correlation

Ridge Regression also be moving towards tends to zero, but not zero.
